Abstract. *This article in all the countries of the world, as happens in other regions in central asia, Uzbekistan and pressing environmental problems, environmental problems in uzbekistan had also become the most dangerous clean air, drinking water, soil structure and the disorder of the nation to the aral sea problem solving should be come of the most basic function of. In addressing this problem, rebuild the island and together they cited the issues of the preservation of the environment.*

Keywords. *the island, ecology, pollution, independent education, teaching methods, methodology, pedagogical technologies.*

Introduction. Read from the system on the same subjects from science and a deep knowledge of the main purpose is to give students. Education in the activities of their lives as a result of the application form is prepared to man up and to work and life. To read what is in solving this kind of problem (educational content), along with how to teaching (teaching methods) issue is also of great importance.

The content of science come from the teaching of any science therefore, the subject defines the intrinsic capabilities of science teaching methods.

Also, the methods of teaching the methods of teaching and to know about qonuniyat, that is, both in the methodology of science is identified.

Available from traditional education methods did not give up the night, in case the method increases the effectiveness of the use of new pedagogical technologies in the lesson. If done with the help of computer technology will save time, but the computer does not know the reader, or erinchoqlik, the data on the computer, you can download written by someone.

Repetition make up a basis of knowledge to manually repeat while writing will remain in place for a better mind than those who see with the eyes. The man with only the imagination will not be prepared to practical activity. To do this, ups and the essence of the law, their development, it is necessary to know the causes of origin to relieve.

Analysis. Today's task of education in the context of ever increasing information on the readers of the educational environment to operate independent of, the rational use of the information flow is to teach.

The general methodological basis of educational technology, methodology, technique the basic principles of the system logic and of the theory of cognition as a new phenomenon in dialectik an intuitive level will bring out the categories and principles of opportunities in the system. The basic theoretical and methodological principles of the system as it appeared, this technology will identify opportunities to build on the basis of basic pedagogical model konseptual.

Konseptual educational complex analysis allows you to the following conclusions:

Any technology on the basis of mutual activities lies in the collective effects in the form of work done. Technology is integrated into the process of work itself. The implementation of educational technology in the process of teaching the significance of pedagogical activity as the form appears in the field.

The ideal form of collective reflection and interaction of the human mind dialectik opposite restated, modified work as it appears. Educational technology and pedagogical practice that appears.

Social technology educational technology, separated from the collective conditional repetiisiyaviy in their development (mashqlantiruvchi) refleks has passed the stage in case of main system operations in accordance with the goal and technological interaction reproduces the action separates. The purpose is also observed that strengthen the mind and experience is being delivered to a new generation social if ideallashtirib while its subject has the description.

The essence of general aspects of educational technology, form and content, the system of confrontation, quantitative and quality changes dialectik construction, validity and the general law of the development of the concept of technology in the framework of umumfalsafiy qonuniyat and can be considered successful. The logic of his action in the field of material production, the production of the review above his spiritual qonuniyat dialectik the opposite aspect, as well as understanding the process of education is to reflect the removal of qonuniyat.

The theoretical basis of educational technology has a solid scientific just like the original of their technology-is based on the theoretical foundation.

To them the opportunity to work on a continuous basis to do this it is necessary to create independent and conditions. For this reason, the educational process texnologiyalashtirish certain tasks in the case of a put, the proper selection of methods and tools for his lessons by intellectual and creative ability the development of the potential of the person in society, increase knowledge and skills of every citizen, quick can create the conditions for learning.

Inexhaustible natural resources available azerbaijanis these theoretical and practical unreasonable the idea of the proof. Therefore, the material needs within

the framework of the economic and environmental needs at the present time is limited to the need arising.

Total man of the needs, capabilities of action for the implementation of the conscious activity. Dark snow tomorrow also I just humanity, but is not committed to the protection of nature, to be torn.

After all, the source of the material blessings that are necessary to the indwelling of human nature did not become, but without the basis of the spiritual life depends on are available.

The second hand on the environmental aspects of economic relations to develop the spiritual needs of nature conservation, management and stand muqobillashtirib factor.

It must be also said that the environment of the person who have enough knowledge on the environmental quality in a form will not be quick.

To do this, tied up with the culture and values of the complex ecological knowledge to the needs of the general interests of society life aylansagina can give the expected results. Understand the need for conservation of human nature to say, but apply it in daily activities, ecological knowledge of the reason loqaydligi religion, ethics rules created and put into stems.

Therefore, the only fail-with the advice of the young generation fighter active in the protection of nature nurturing individuals who meet the requirements of the current environmental situation is very difficult from a practical aspect. The person of different socio-economic, spiritual, environmental, political relations applied to the content may not solve this task without singdirmasdan.

Conclusion:We have been conducted in the field of globalization and the problem of its clean water, it is intended that we dwell about the work conducted and will be conducted and the study of the natural sciences with regard to this theme were. From this information, physics, chemistry, biology and environmental science teachers according to the purpose for the use of their work. Environmental problems, especially the most pressing problems of today is the atmosphere.

Man is not simply a part of nature, but his wit, intelligence, an active and insightful creature. Man never out of nature, to live and not to live without constant communication and being in a relationship with him cannot even. The great gift of allah odamzotga natural riches are a blessing. Dating and all of nature-the blessing of the man himself enjoy, from rich natural to a high happiness.

In this context, we contribute a little to eliminate the same problems, even if we think that. Physics lesson in the "Atmospheric pollution and its theme was" stronger in the minds of students through the explanation leads to the expression I have tried to achieve further environmental education.
